### REASONS FOR ALLOWANCE

1. Claims 1 and 3-17 are allowed.
2. The following is an examiner's statement of reasons for allowance:

The prior art of record fails to teach or to reasonably suggest the invention described in claims 1 and 13, said invention drawn to a photo detector for, when light emitted from a two-wavelength light source is divided into at least three light components to be reflected by an optical recording medium, detecting the reflected light components, the photo detector comprising:

a first detector divided into *no more than eight* sections detecting the at least three light components reflected by the optical recording medium to convert the light components into a first set of electrical signals;

a first calculating portion calculating a first tracking error signal from the first set of electrical signals converted by the first detector by a differential push-pull method;

a second calculating portion calculating a first focusing error signal by an astigmatism method and calculating a second tracking error signal by a differential phase detection method from the first set of electrical signals converted by the first detector;

a second detector detecting the at least three light components reflected by the optical recording medium to convert the at least three light components into a second set of electrical signals; and

a third calculating portion calculating a second focusing error signal by the astigmatism method and calculating a third tracking error signal by the differential phase detection method from the second set of electrical signals converted by the second detector,

wherein the first detector includes:

a first central sensor having a region divided vertically and horizontally into four sub regions detecting a central light component among the at least three light components reflected by the optical recording medium to convert the central light component into the first set of electrical signals;

a first peripheral sensor having a region divided vertically or horizontally into two sub regions detecting a first peripheral light component among the at least three light components reflected by the optical recording medium to convert the first peripheral light component into the first set of electrical signals; and

a second peripheral sensor having a region divided vertically or horizontally into two sub regions detecting a second peripheral light component among the at least three light components detected by the optical recording medium to convert the second peripheral light component into the first set of electrical signals.

as specifically described and connected to the other elements recited in claims 3-12 and 14-17.

**Kosoburd (US 2003/0206503)** teaches a first detector comprising a first central sensor having four sub regions (A,B,C,D) and a first and second peripheral sensor, each having two sub regions (J,K,L,M). However, the signals which are output from the

first and second peripheral sensors (JKLM) are not used for generating a first tracking error signal, a first focusing error signal, or a second tracking error signal, as is required by Applicant's claim. See the "first signal" of Applicants claim, generated by all sub regions of the first detector, said first signal used to generate a first tracking error signal, a first focusing error signal, and a second tracking error signal. The first and second peripheral sensor (J,K,L,M) of Kosoburd, are instead used to generate variations in track pitch or magnification error values.

### ***Conclusion***

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
